

Experimental Frontiers in Nucleon Decay

Ed Kearns, Boston University

NNN 2012

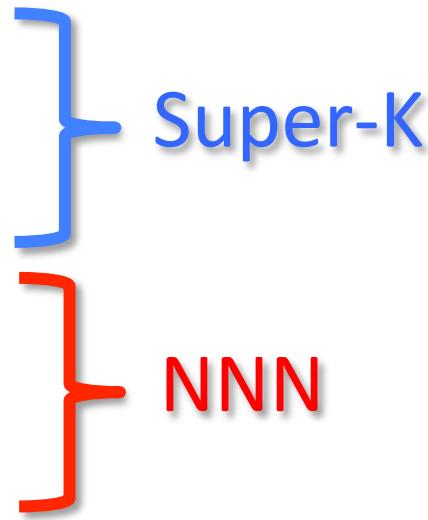

Next Generation Nucleon Decay and Neutrino Detectors

~ 0.5 Mt yr exposure
by Super-K before next
generation experiments

Starting time? Guess 1 decade from now.
Adjust starting time as you wish.

What moves us towards the frontiers?

- ❖ Continue exposure
 - ❖ Improve analysis
 - ❖ Search in new channels
 - ❖ Next generation experiments
 - Detector R&D
 - Experiment proposals
- 

Hyper-Kamiokande	560 kton water cherenkov	99K PMTs (20% coverage)
LBNE	10/20 kton LAr TPC	surface/underground?
GLACIER/LBNO	20 kton LAr TPC	2-phase
LENA	51 kton liquid scintillator	30,000 PMTs

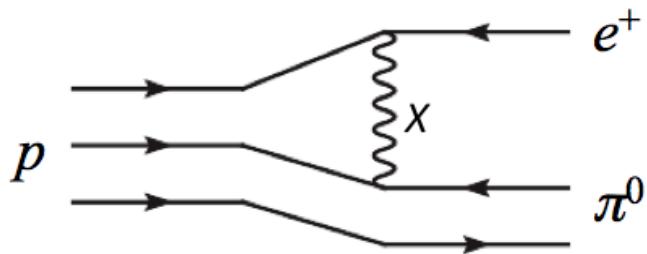

How to improve existing analyses

- ❖ Sensitivity is based on:

$$\frac{\tau}{B} = \frac{N_0 \Delta t \epsilon}{n_{obs} - n_{bg}}$$

- ❖ Achieve: higher efficiency, lower background rate
- ❖ Also important: improve accuracy of model (signal and/or BG) (which may increase or reduce sensitivity)
- ❖ Also: reduce systematic uncertainty
- ❖ None of this is easy – gains will be small and hard fought
- ❖ Increased exposure – gains are now minimal

$$p \rightarrow e^+ \pi^0$$

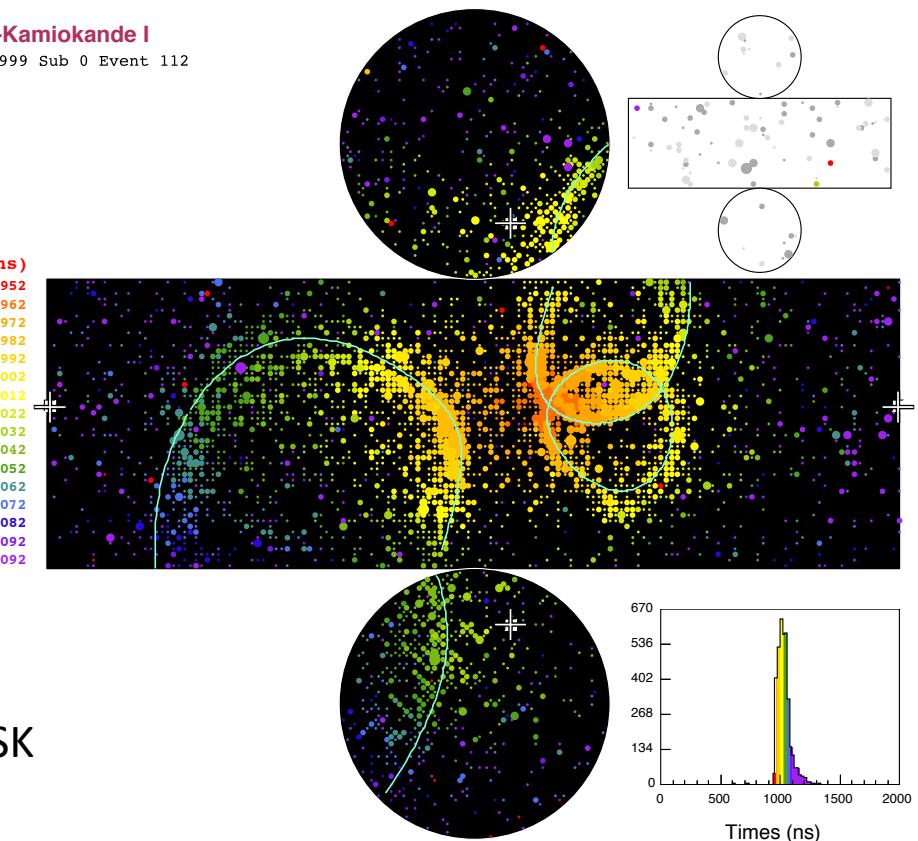

Simple signature: back-to-back reconstruction of EM showers.

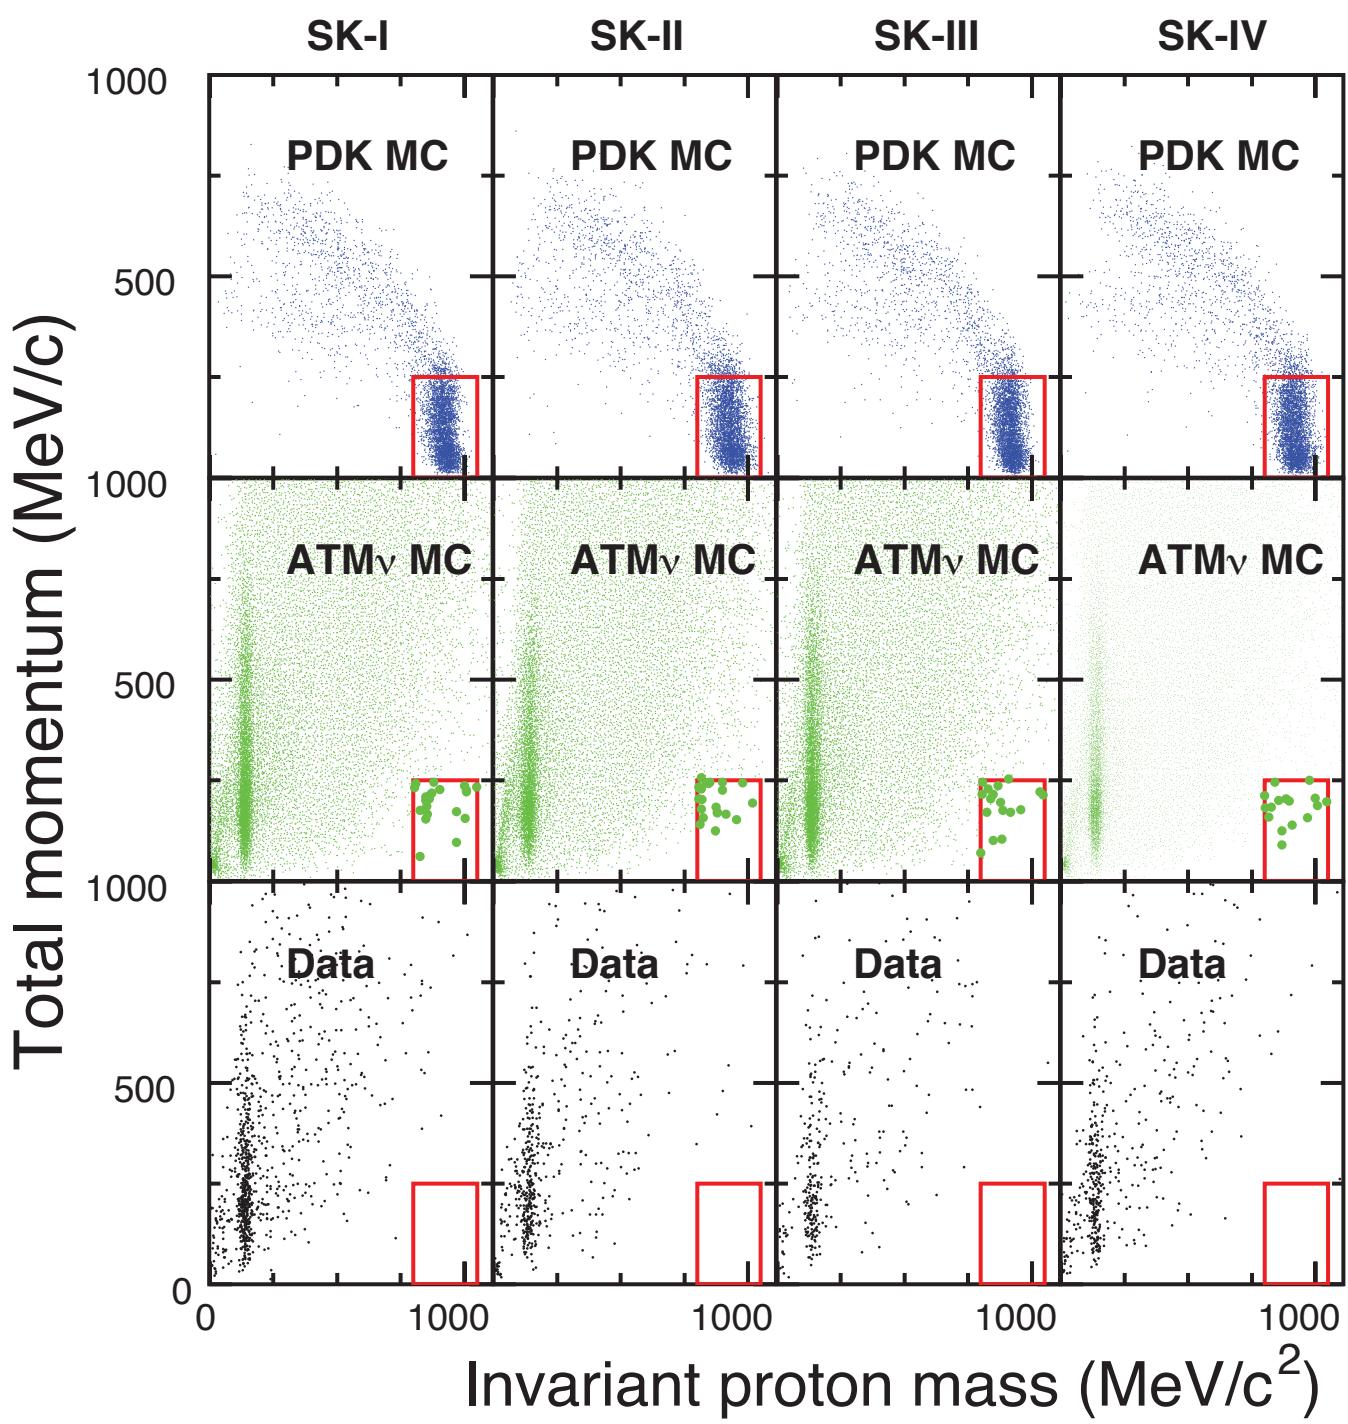

Efficiency ~45% dominated by nuclear absorption of π^0

Low background ~0.2 events/100 ktyr in SK

Relatively insensitive to PMT density.

Super-Kamiokande I
Run 999999 Sub 0 Event 112

SK 1+2+3+4
 $\tau/B > 1.3 \times 10^{34} \text{ yr}$
PhysRevD.85.112001

Efficiency and Background

EFFICIENCY	SK1	SK2	SK3	SK4
$e^+\pi^0$	$44.6 \pm 0.7\%$	$43.5 \pm 0.7\%$	$45.2 \pm 0.7\%$	$45.0 \pm 0.7\%$
$\mu^+\pi^0$	$35.5 \pm 0.7\%$	$34.7 \pm 0.6\%$	$36.3 \pm 0.7\%$	$43.9 \pm 0.7\%$

- Determined by Super-K proton decay Monte Carlo simulation
- Lower efficiency for $\mu^+\pi^0$ is due to required decay electron tag, but effect of better electronics in SK4 can be seen

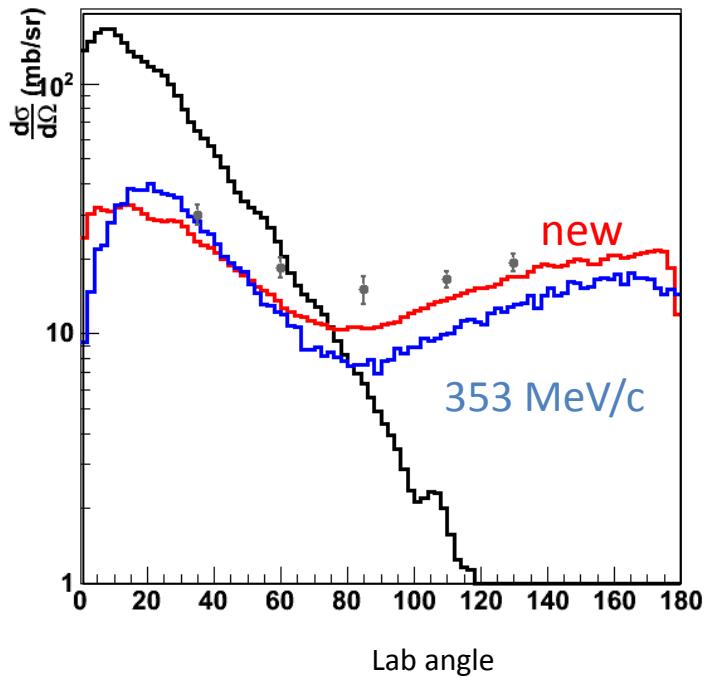

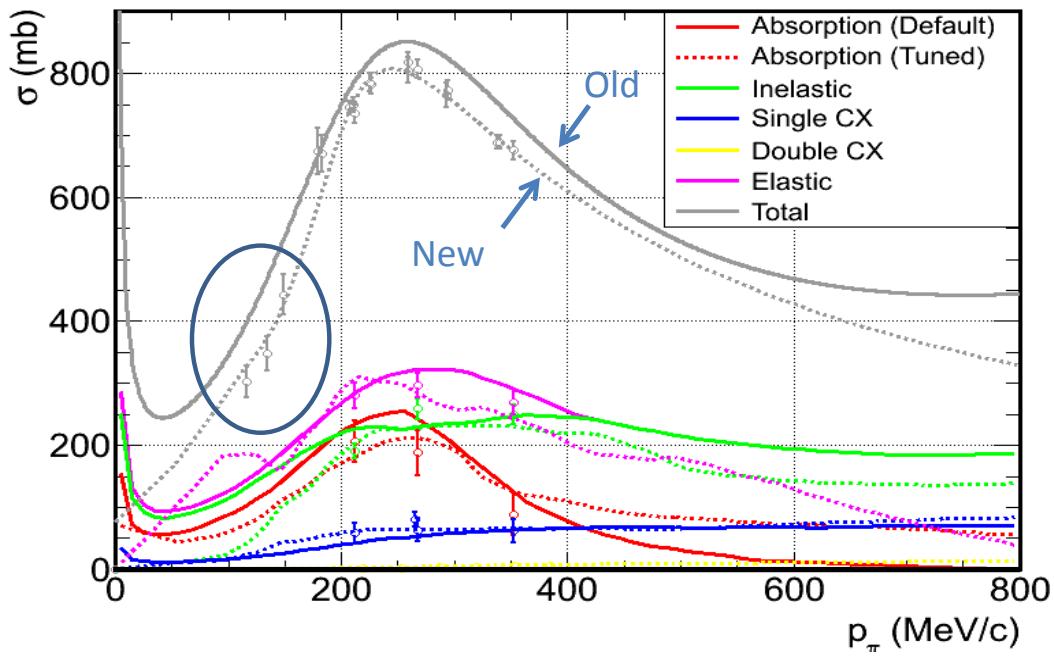

BKG RATE (ev/Mt y)	SK1	SK2	SK3	SK4
$e^+\pi^0$	2.1 ± 0.5	2.2 ± 0.5	1.9 ± 0.5	1.6 ± 0.4
$\mu^+\pi^0$	2.6 ± 0.5	2.1 ± 0.4	2.6 ± 0.5	3.6 ± 0.5

- Background rate checked using K2K near detector:

$$e^+\pi^0 \text{ BG} = 1.63_{-0.33}^{+0.42} (\text{stat})_{-0.51}^{+0.45} (\text{sys.}) \text{ evts/Mt} \cdot \text{yr}$$

Continual Improvements

E.g. Pion interaction Monte Carlo (NEUT) – intranuclear scattering

Also:

Detector simulation tuning

Improved reconstruction (“all new” is in the works)

Atmospheric neutrino flux, cross section

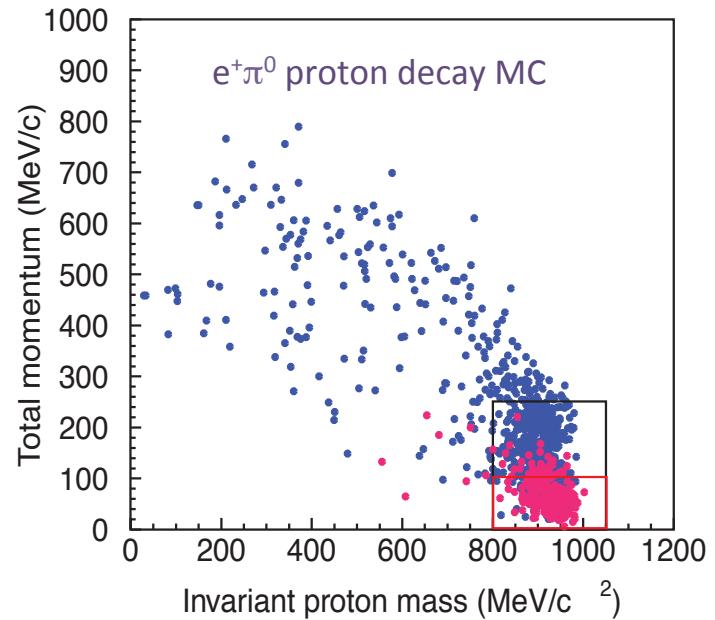

Background Reduction Strategies

❖ Tight Cuts on Free Proton

- efficiency $\sim 17\%$
- BG 0.015 evts/100 kton yr
- change over around 10-20 Mton yr

❖ Gadolinium

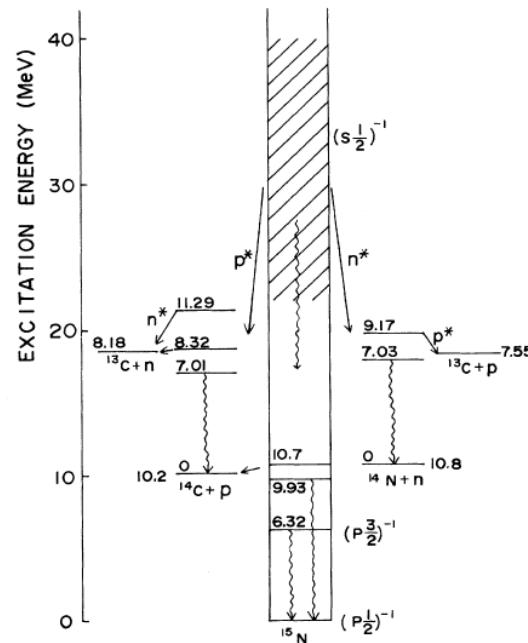

- high energy neutrino events are accompanied by n
- assume proton decay is not accompanied by n
 - * surely not for free proton
 - * also not for γ -tag states
- consider Gd addition to WC to increase n -capture tag efficiency
- Gadolinium R&D underway at SK

Background events for $p \rightarrow e^+ \pi^0$ (4.5Megaton years)

	v interactions	secondary interactions in water
1	$vn \rightarrow e^- p \pi^0$	Neutron production by the proton
2	$vp \rightarrow e^- p \pi^+$	Neutron by π^+
3	$vp \rightarrow e^- p(\pi^+) \pi^0$	
4	$vn \rightarrow vp \pi^+ \pi^0$	
5	$vn \rightarrow e^- p$	Neutron by the proton
6	$vn \rightarrow e^- n \pi^+ \pi^-$	
7	$vp \rightarrow e^- p(\pi^+) \pi^0$	
8	$vp \rightarrow vpp$	
9	$vO \rightarrow e^- O \pi^+$	Neutron by π^+
10	$vn \rightarrow np$	neutron and π^+ by the neutron

Neutron Production with ν : Experiments

- New SK electronics (SK4 only) allows search for neutron associated with atmospheric neutrinos (capture on free proton, 2.2 MeV γ). 
- Other current, near future, and recent past experiments can also search. T2K, SciBooNE e.g.
- Dedicated new experiment (ANNIE) under discussion.

Antilepton + Meson Two-Body Modes

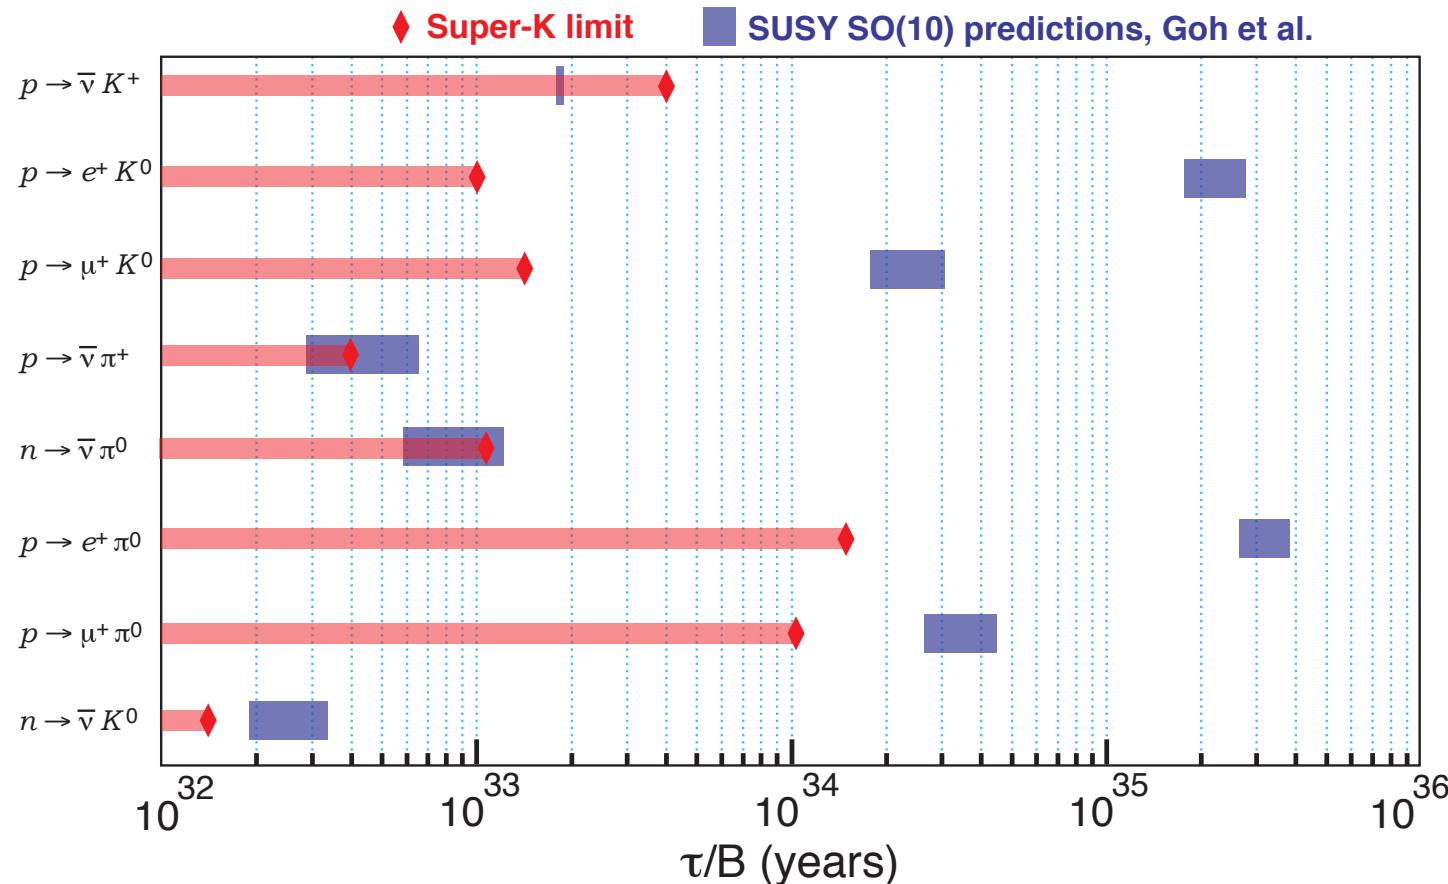

CASE STUDY:

Using inclusive searches to constrain a particular model

SUSY SO(10), B-L broken by 126-Higgs† H.S.Goh, R.N.Mohapatra, S.Nasri, S-P. Ng, Phys Lett B587:105-116 (2004)

- predicts neutrino mixing well
- scan over parameter space – find unconstrained branching fraction
 - maximize $n \rightarrow \nu \pi^0$
 - N.B.: old νK^+ limit used as fixed constraint

** C. Regis *et al.* Phys.Rev.D.86.012006 ($K_S + K_L$)

Q: What other modes are interesting?

CASE STUDY:

Dinucleon Decay $pp \rightarrow K^+K^+$

Allow R-parity violation to reduce fine-tuning[†]

- allows one to sneak in a light Higgs
- avoid fast proton decay by allowing B-violation only and not also L

[†] L. Carpenter, D.E., Kaplan S.Nasri, E. Rhee,
hep-ph/0607204v3

$$W \supset \mu_i L_i \bar{H} + \lambda_{ijk} L_i L_j E_k^c + \lambda'_{ijk} L_i Q_j D_k^c \quad \text{violates Lepton number}$$

$$+ \lambda''_{ijk} U_i^c D_j^c D_k^c, \quad \text{violates Baryon number}$$

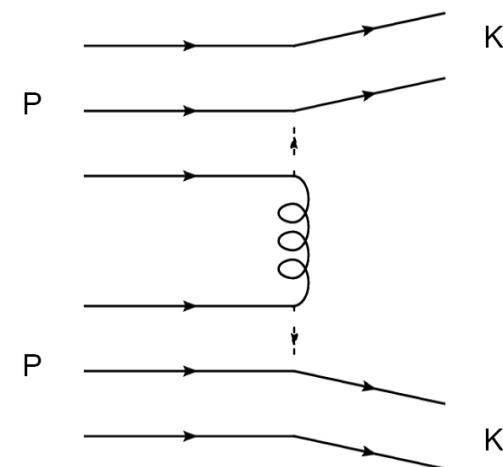

- existing constraints on coupling λ'' taken from dinucleon decay (!)

$\Delta B = 2$ dinucleon modes

The following are lifetime limits per iron nucleus.

τ_{64}	$pp \rightarrow \pi^+ \pi^+$	> 0.7
τ_{65}	$pn \rightarrow \pi^+ \pi^0$	> 2
τ_{66}	$nn \rightarrow \pi^+ \pi^-$	> 0.7
τ_{67}	$nn \rightarrow \pi^0 \pi^0$	> 3.4
τ_{68}	$pp \rightarrow e^+ e^+$	> 5.8
τ_{69}	$pp \rightarrow e^+ \mu^+$	> 3.6
τ_{70}	$pp \rightarrow \mu^+ \mu^+$	> 1.7
τ_{71}	$pn \rightarrow e^+ \bar{\nu}$	> 2.8
τ_{72}	$pn \rightarrow \mu^+ \bar{\nu}$	> 1.6
τ_{73}	$nn \rightarrow \nu_e \bar{\nu}_e$	> 0.000049
τ_{74}	$nn \rightarrow \nu_\mu \bar{\nu}_\mu$	
τ_{75}	$pn \rightarrow \text{invisible}$	$> 2.1 \times 10^{-5}$
τ_{76}	$pp \rightarrow \text{invisible}$	> 0.00005

- ❖ These limits are per Fe nucleus, from Frejus experiment, circa 1991
- ❖ No searches for $NN \rightarrow KK$

K^+ are above Cherenkov threshold ($p \approx 800$ MeV/c)

Displaced vertices
 K -like particle ID

Dinucleon Decay $pp \rightarrow K^+K^+$ Results

M. Litos, Ph.D. thesis

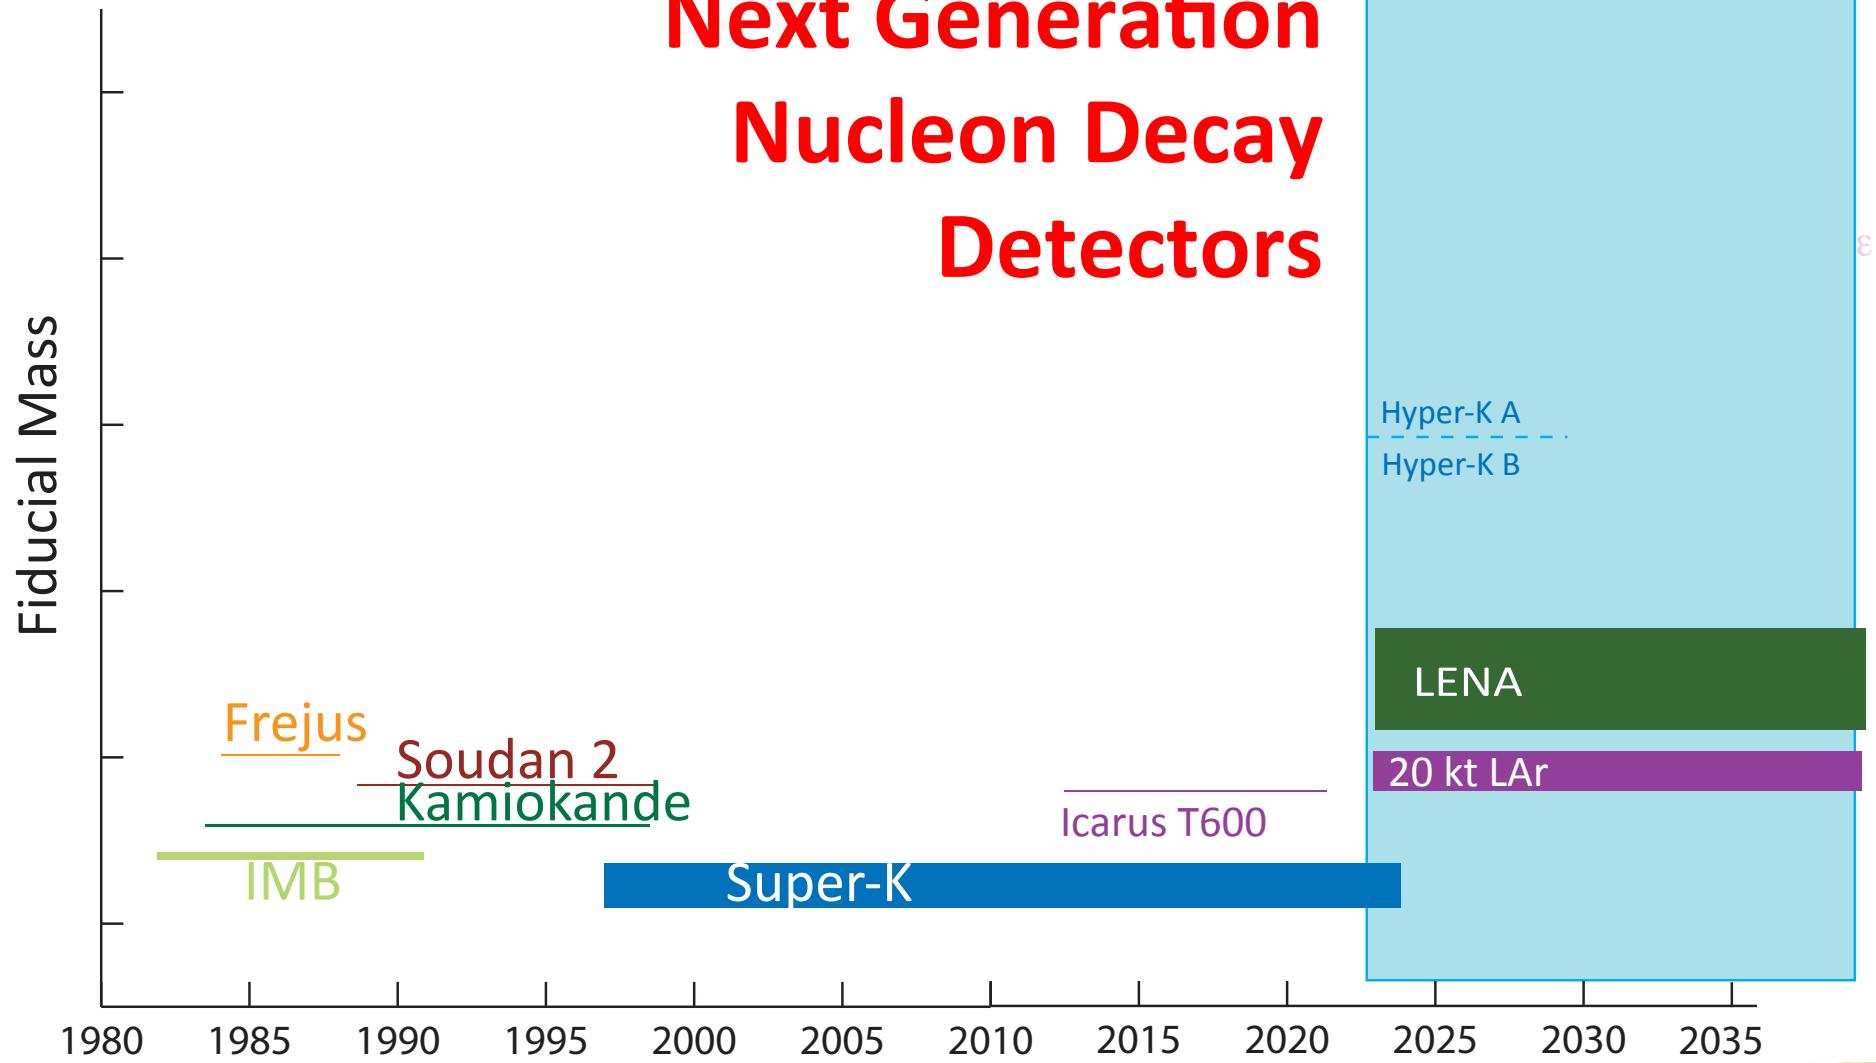

$$\tau/B > 1.7 \times 10^{32} \text{ years}$$

(90% CL, SK1)

$$\lambda''_{112} < 8 \times 10^{-9}$$

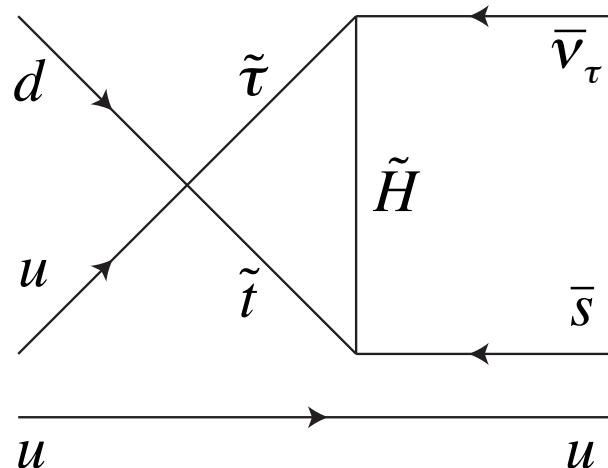

Two orders of magnitude smaller than limit inferred
from Frejus results (non KK): Goity & Sher, PLB346 (1995)

Next Generation Nucleon Decay Detectors

$$p \rightarrow \nu K^+$$

SUSY, better gauge unification
D=5 operator

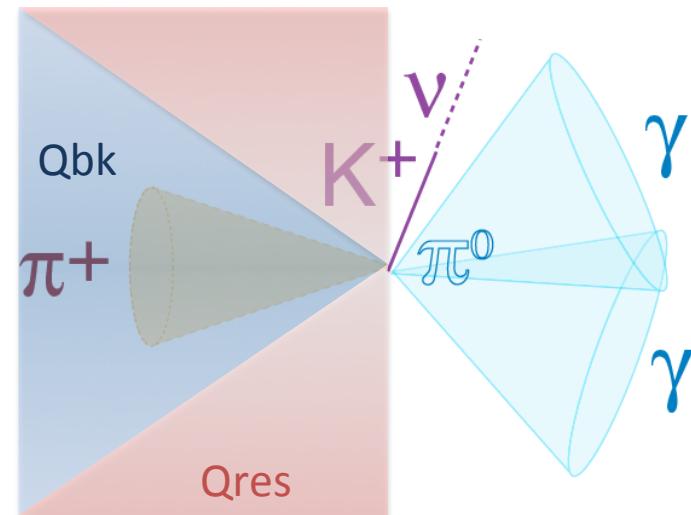

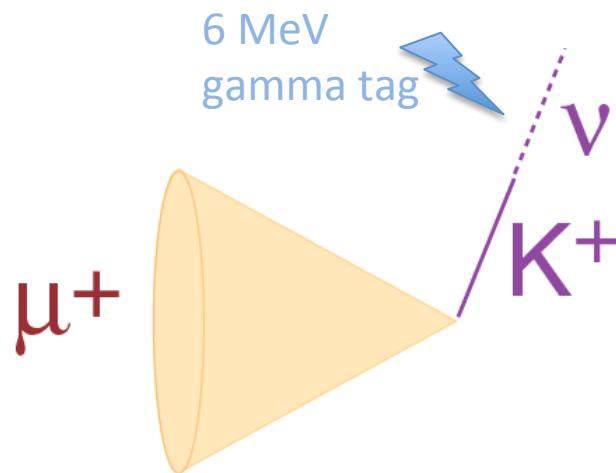

Water: charged kaon below Cherenkov threshold but
 ^{16}O gamma can be used to tag in WC ($\varepsilon \sim 16\%$ for 2 low BG kaon modes)

Liquid Scintillator: Kaon decay energy and time
well measured in LS ($\varepsilon \sim 65\%$)

LAr TPC: Charged kaon leaves track
with correct dE/dx ($\varepsilon \sim 97\%$)

νK^+ in Water Cherenkov

γ -tag and $\pi^+\pi^0$	SK1	SK2	SK3	SK4
Efficiency	13.7 %	11.1 %	13.9 %	16.1 %
Background rate (/Mt yr)	6.7 ± 0.7	8.3 ± 0.8	5.7 ± 0.8	8.0 ± 0.8

No candidates, 220 kton yr (SK 1+2+3+4):

$$p \rightarrow \nu K^+ \tau / B > 4.0 \times 10^{33} \text{ years, 90\% CL}$$

LENA

Low Energy Neutrino Astronomy

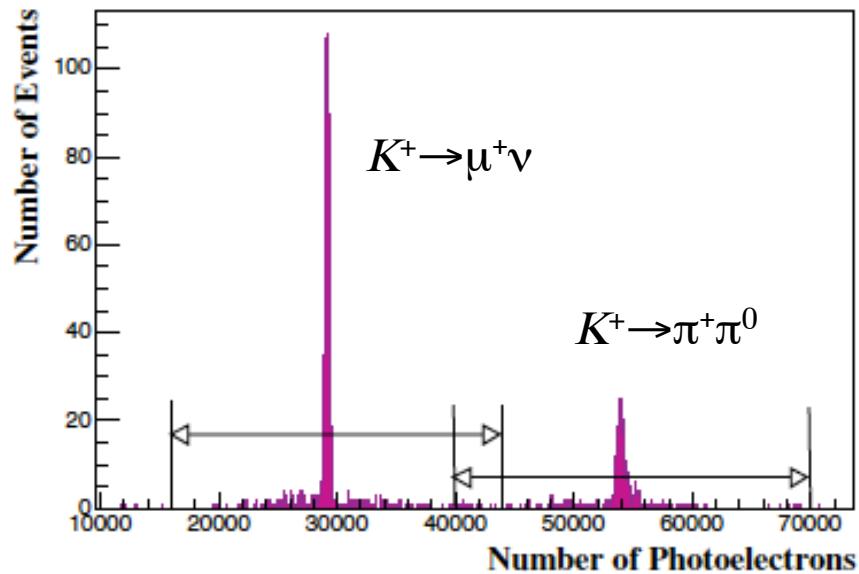

- 51 kt liquid scintillator (FV)
- 32m x 100m
- 30000 PMTs (30% with Winston cones)
- Water Cherenkov veto

$$p \rightarrow \nu K^+$$

Efficiency estimate ~ 65%

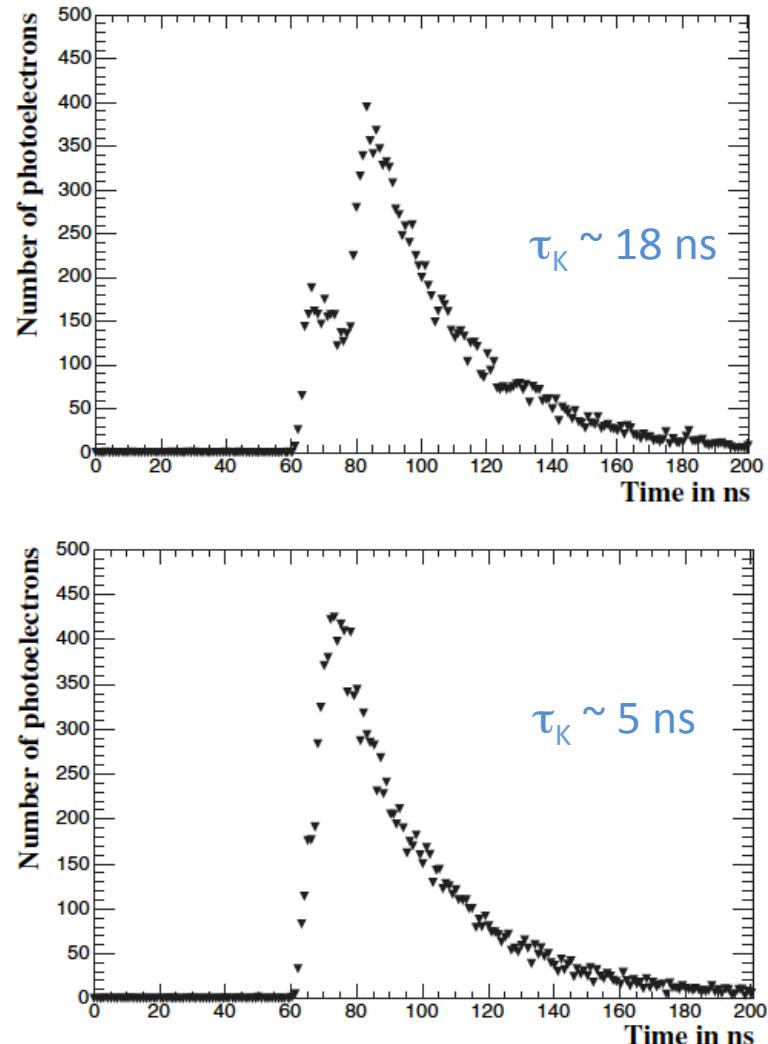

Background rate ~ 1/yr/50 kton

Energy Response

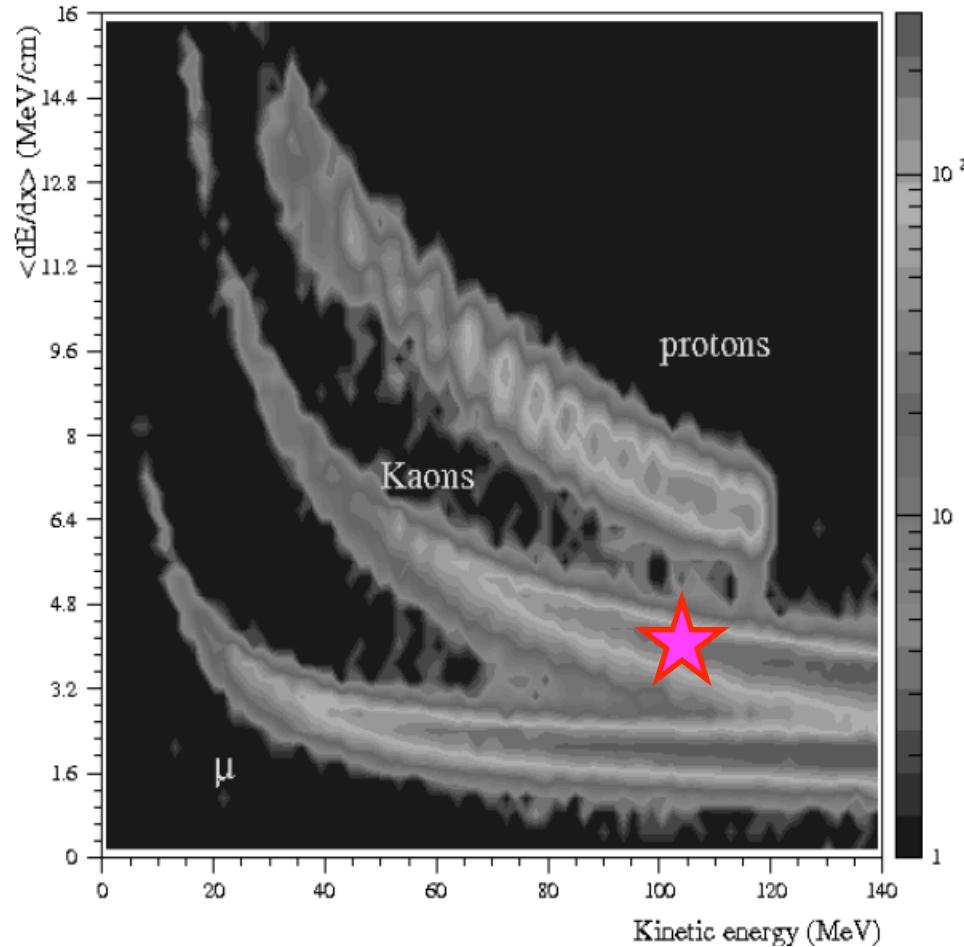

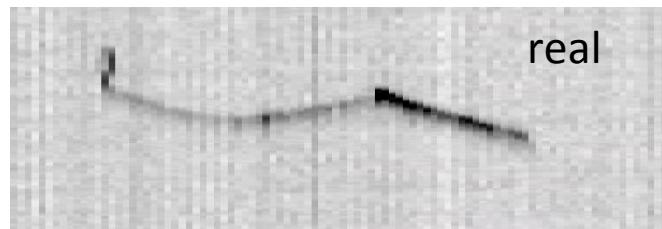

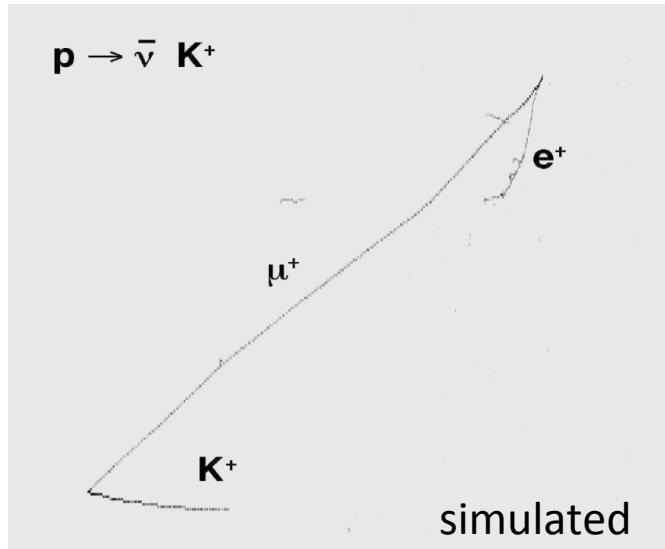

- 200 photoelectrons/MeV (40x Super-K)

Residual Timing Distributions (single events)

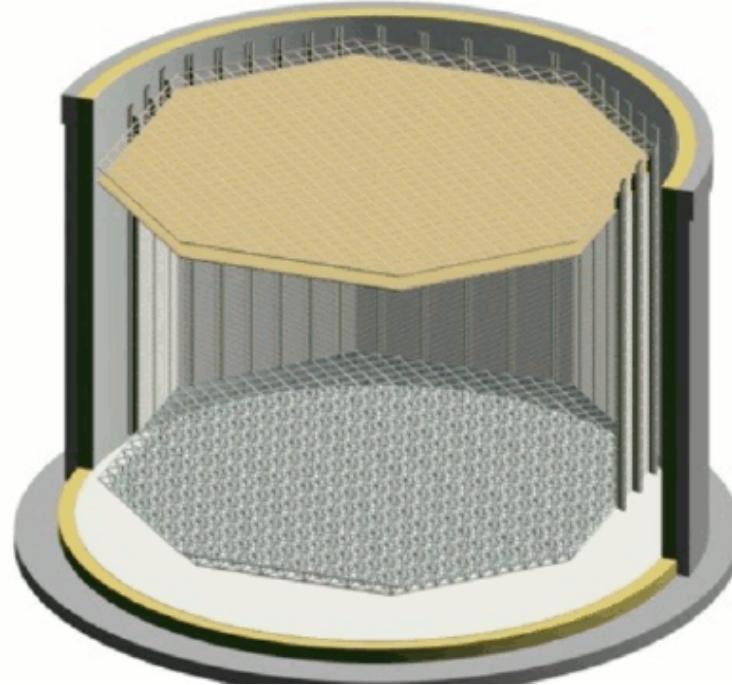

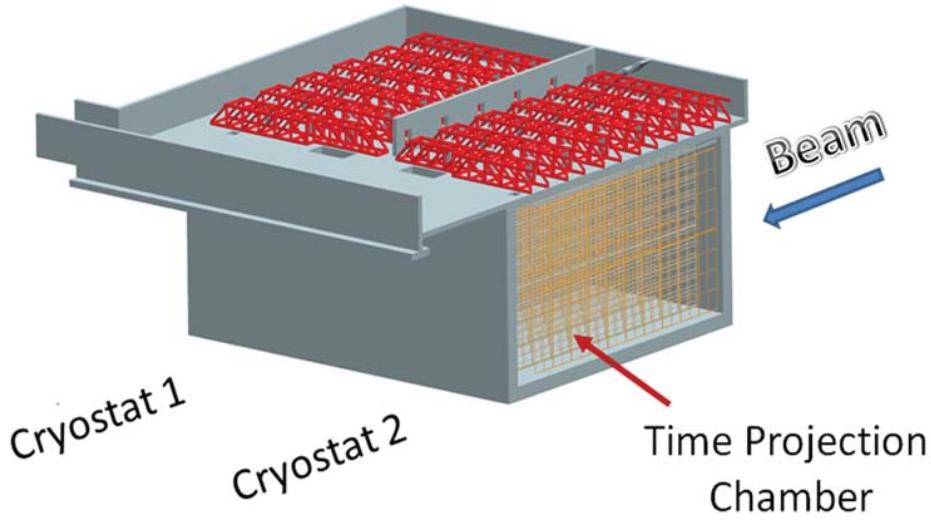

νK^+ in LAr

$E_{vis} < 0.8$ GeV	96.8%	0	0	0	0	1	0

LBNE

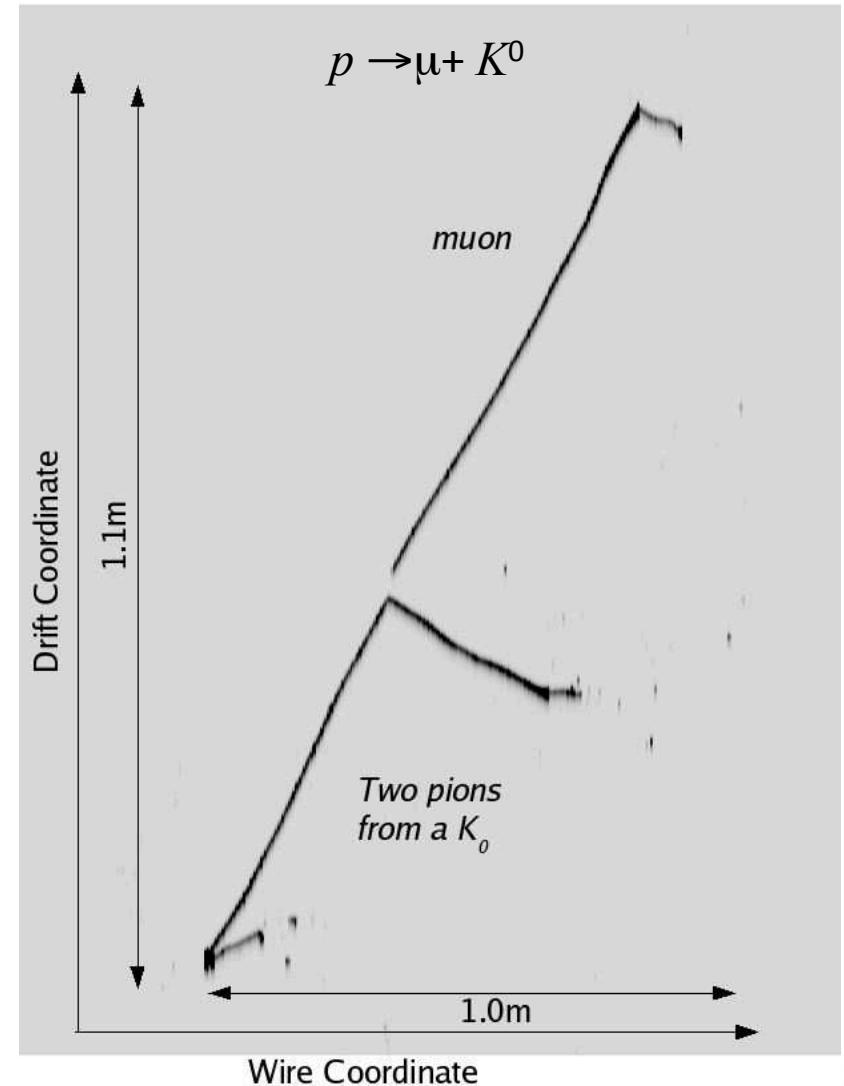

GLACIER/LBNO

- ❖ Two very different technical designs – which is best?
- ❖ Validate the 97% efficiency assumption, as well as low BG
- ❖ Essential to get LBNE underground, and with no beam trigger
- ❖ At least 20 kton is preferred – proton decay needs MASS.

What Other Modes are Good for LAr?

- ❖ Modes with charged kaon in final state
- ❖ Modes with displaced vertices \Rightarrow
- ❖ Multi-prong modes with no neutrino
- ❖ Lepton + light meson are no better than water due to nuclear absorption of the light meson.

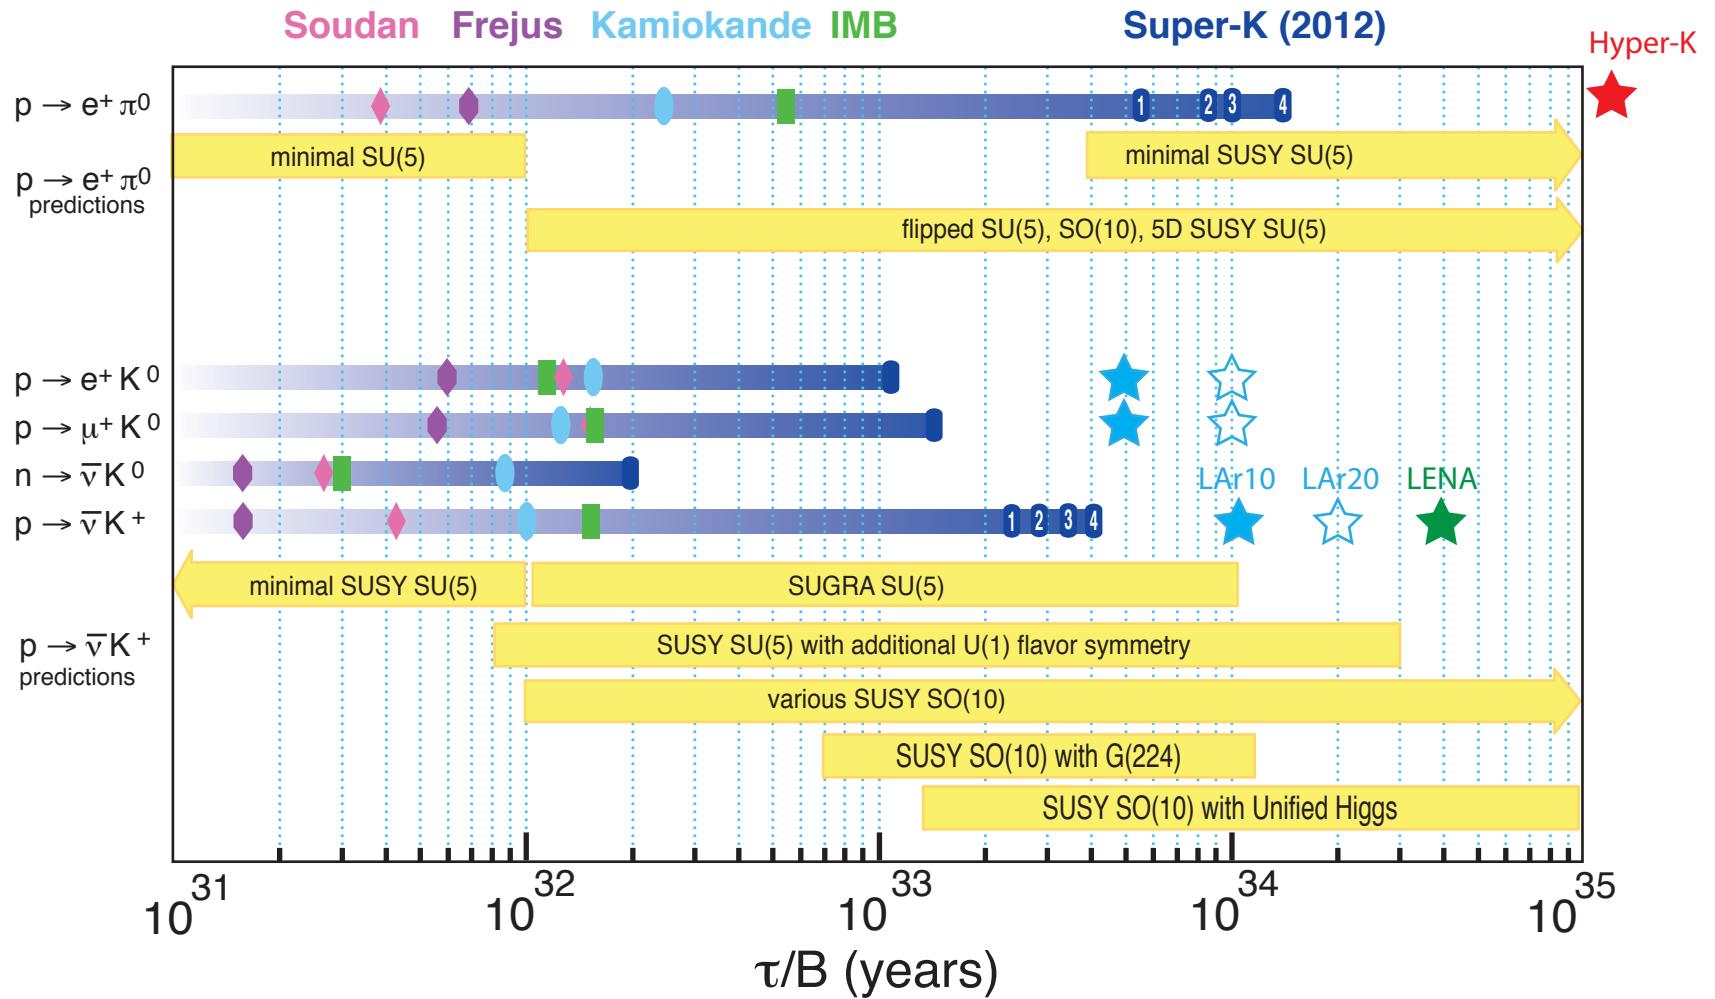

What Other Modes are Good for LAr? (2)

	Mode	Super-K Water Ch.		LAr (generic)	
		Efficiency	BG Rate (/Mt y)	Efficiency	BG Rate (/Mt y)
B-L	$e^+ \pi^0$	45%	2	45%	1
	νK^+	16%	7	97%	1
	$\mu^+ K^0$	10%	5-10	47%	<2
B+L	$\mu^- \pi^+ K^+$?	?	97%	1
	$e^- K^+$	10%	3	96%	<2
$\Delta B=2$	n nbar	12%	260	?	?

Rough and unofficial
SK efficiency & BG - ETK

A. Bueno et al.
hep-ph/0701101

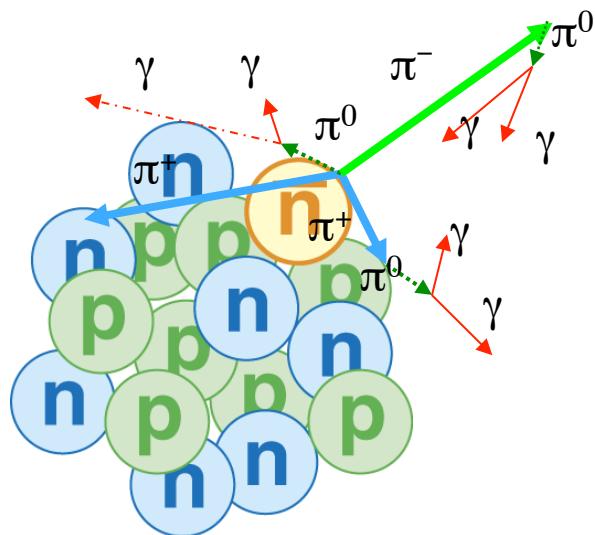

Conclusion

- ❖ The frontier is, for now, defined by further SK running, improvements, and new analyses
- ❖ The next generation experiment is needed to gain an order of magnitude in nucleon decay sensitivity
- ❖ The motivating factors are as strong as ever
- ❖ The motivation could become stronger with
 - ❖ Clear signs of SUSY at the LHC
 - ❖ Candidate events at SK
 - ❖ Serious reduction in cost to do the experiment

EXTRA

Neutron Antineutron Oscillation

$3\pi^+2\pi^-\pi^0$	7%	$2\pi^+2\pi^-\pi^0$ 24%
		$\pi^+\pi^-\omega$ 10%
		$2\pi^+2\pi^-2\pi^0$ 10%

TABLE I: The branching ratios for the \bar{n} +nucleon annihilations in our simulations. These factors were derived from $\bar{p}p$ and $\bar{p}d$ bubble chamber data [12] [13] [14].

- ❖ Created antineutron annihilates with nearby nucleon
- ❖ About 2x nucleon mass is released as pions
- ❖ Final states may be predicted from annihilation data

Super-Kamiokande nnbar Result

arXiv:1109.4227

BG Interactions:

CC 1 π : 27.2% (6.5 evt)

NC 1 π : 4.1% (1.0 evt)

CC m π : 32.5% (7.8 evt) ←

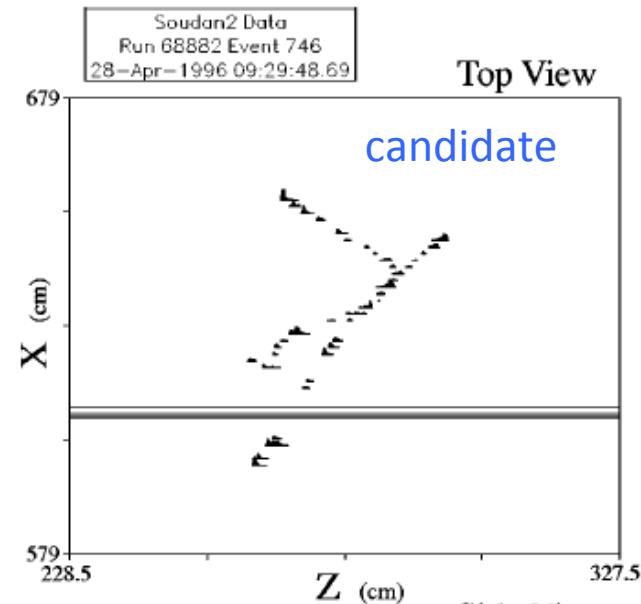

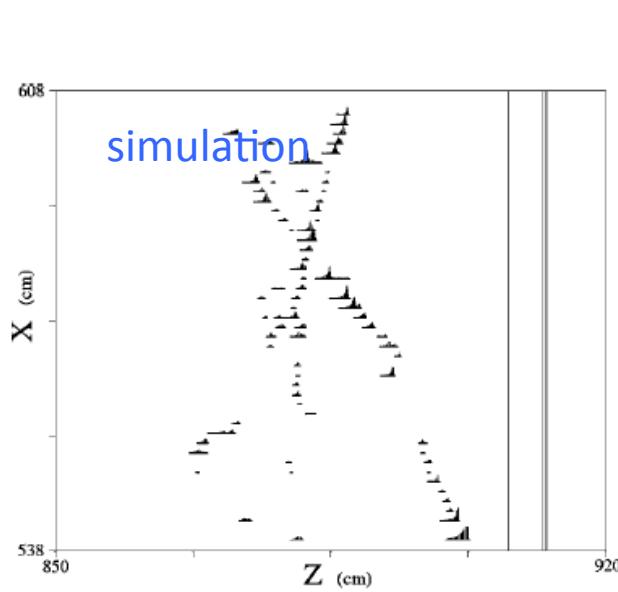

NC m π : 25.4% (6.1 evt)

$$T_{\text{bound}} > 1.89 \times 10^{32} \text{ years}$$

$$\tau_{\text{free}} = \sqrt{\frac{T_{\text{bound}}}{1 \times 10^{23} \text{ s}^{-1}}} = 2.4 \times 10^8 \text{ s}$$

Iron Calorimeters

(Get a feel for how a Lar TPC analysis might proceed)

Soudan 2:

- hand scan
- require $n_{\text{charged}} \geq 4$
- eliminate protons, muons
- kinematic cuts

LAr compared to Iron Calorimeters:

- can do better than requiring $n_{\text{ch}} \geq 4$

LAr compared to WC

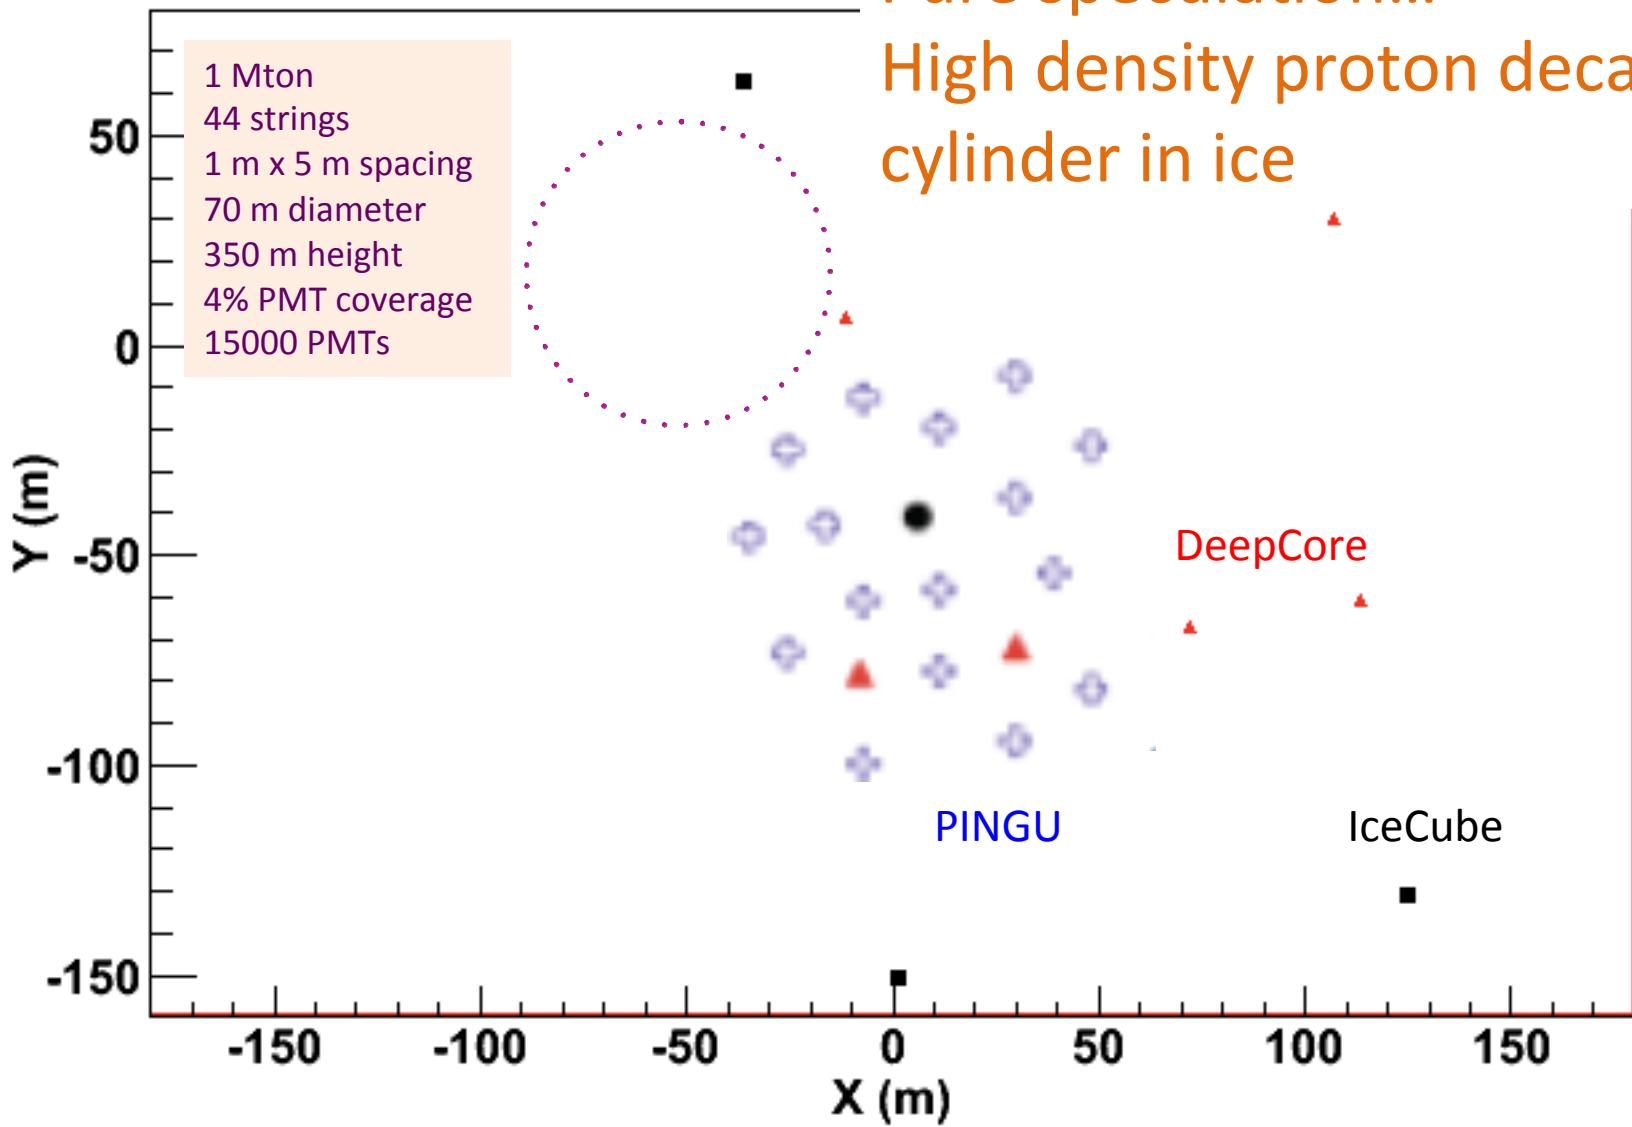

- can resolve recoil proton, charged current lepton

Back of the envelope estimate suggests even 10 kton LAr can do x10 better than SK
